

Description

For fully automatic moulding lines, moulding systems of 275 / 425 / 600 / 800 and 1000mm width are designed. The system incorporates a double twisting station, tilting unit, knocking station. An automatic mould dirty control checks and ejects the mould before returning towards the front of the line.

The demoulding station transfers the demoulded and aligned products onto a PU transport belt. After this the products can be fed directly towards a packing line.
